

Rammer C350 takes over at Red Hill

The Rammer C350 boom system replaced the 20-year old Rammer C330 boom system at Hanson's Red Hill quarry in WA.

The Rammer rockbreaker 1655 is an 870kg rockbreaker. Both machines were supplied by Total Rockbreaking Solutions.

ALMOST 20 years ago, Hanson acquired a Rammer C330 boom system with Rammer E64 rockbreaker for its operation at the Red Hill quarry in WA.

Since its installation in 1997, the rockbreaker hammer has been operating above a jaw crusher clearing blockages quickly and efficiently.

Hanson's Red Hill, 25km from Perth, is quarrying dolomite, granite, rock and other aggregates for concrete, asphalt, backfill, paving and other civil construction applications.

Since installation the Rammer rockbreaker boom system has never missed a beat clearing blockages and bridging, but this year it was decided to upgrade the boom system to achieve a longer vertical reach.

Total Rockbreaking Solutions, the exclusive authorised Rammer dealer in WA, recommended the Rammer boom system C350 and Rammer rockbreaker 1655 for the job.

C350 has a maximum reach of 5.4m – 500mm longer than the previous model – and new technology that enables the

optimal positioning of a rockbreaker within a crusher's feed, allowing blockages and bridging of rock to be broken and cleared quickly and efficiently.

"Other boom systems on the market were explored but having seen the reliability of Rammer and acknowledging Rammer as one of the most recognised and trusted brands on the Australian market it made sense to enquire about acquiring another Rammer breaker boom system," the Red Hill quarry manager said.

Rammer 1655 is an 870kg rockbreaker

with an impact rate of 500 to 940 blows per minute featuring Rammer's patented fixed blow energy operating principle that ensures optimum impact energy with every blow, regardless of hydraulic flow fluctuations.

As with most Rammer breakers, the 1655 breaker also comes backed with Rammer's lifetime warranty, which for a professional user is a maximum of 10 years.

"Features like these and the proven reliability ensure that we can carry out this task as efficiently as possible," the quarry manager said.

RAMMER HITS CONSISTENTLY HARDER

Rammer's sealed high pressure Membrane Accumulator system ensures constant and high breaking power and with Rammer's patented Fixed Blow Energy operating principle you can reduce breaking times and maximise productivity.
